Delta PC-Based Motion Controller PAC Total Solution

Delta PC-Based Motion Controller PAC Total Solution

Delta's PAC platform is a solution with high reliability, integrated network communication capability, and high-end motion control functions, and is ideal for advanced automation machining. Through EtherCAT or DMCNET communication, the platform is able to perform high-response, high-precision, and synchronous multi-axis motion control with easy and flexible operation.

Its cable-less and fan-less design enhances reliability and resistance for harsh environments and contaminants. It is also implemented with an X86 dual-core processor and EtherCAT or DMCNET communication that enables faster and more convenient data transmission.

With the built-in dynamic-link library (DLL), the controller of the platform effectively simplifies the implementation process and saves development time. In addition, the integrated versatile software of the platform provides a perfect integration of logic programming control (with SoftPLC), human machine interface (with SoftHMI), numeric control and robot control, supporting IEC61131-3 programming languages and high performance motion control for a wide range of applications and industries.

Delta's PAC platform offers a comprehensive, highly integrated, and easy industrial PC-based motion control solution to help optimize customers' competitiveness with capabilities for getting ahead of the game.

High-Speed Motion Control System - EtherCAT

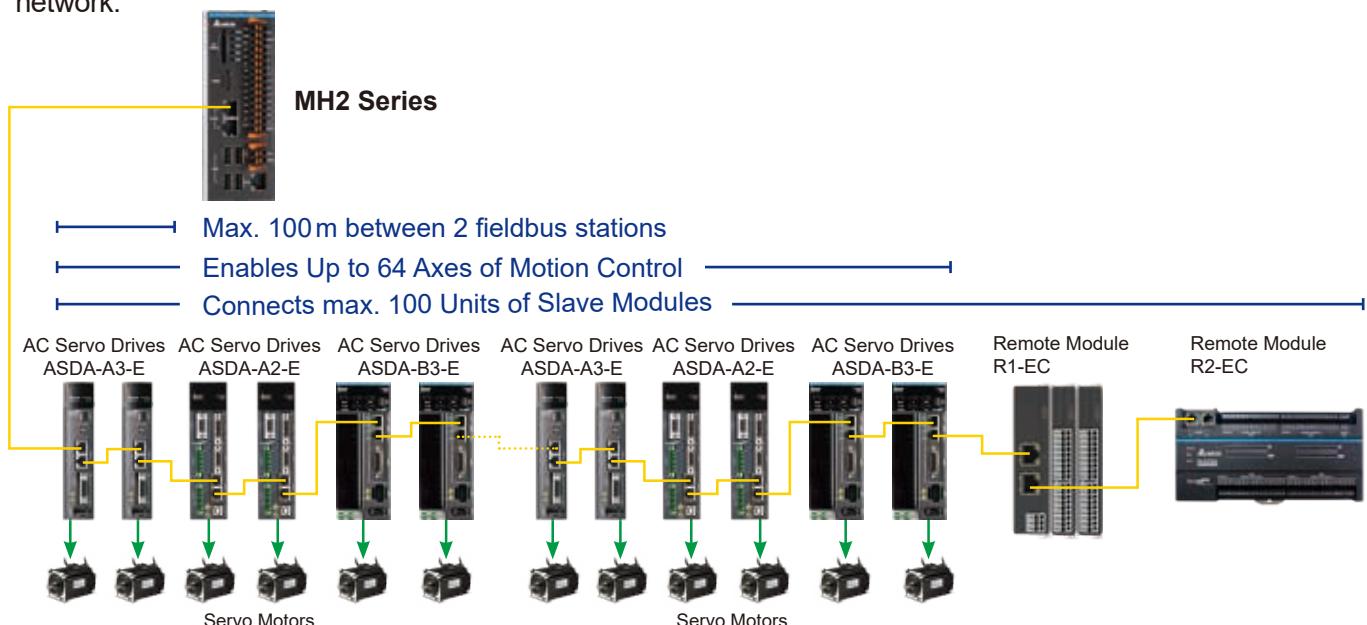

Ethernet Central Automation Technology (EtherCAT) is an open Ethernet-based fieldbus system that provides high-efficiency and high-performance synchronization quality for automation control. Delta's EtherCAT motion control solution achieves rapid and real-time multiple axes of motion control, and is capable of controlling up to 100 slave stations that enable a 64-axis motion control within 1ms cycle time. It also provides 35 homing modes, point-to-point position control, 2-axis interpolation, 3-axis interpolation, multi-axis synchronization, continuous motion, gantry control, speed control, torque control, ECAM and Motion Buffer functions.

EtherCAT Motion Control Structure

Delta provides a rugged and high-speed motion control solution with complete functions for EtherCAT masters, and that supports device description in XML format (EtherCAT Slave Information - ESI) that are useful for EtherCAT device development.

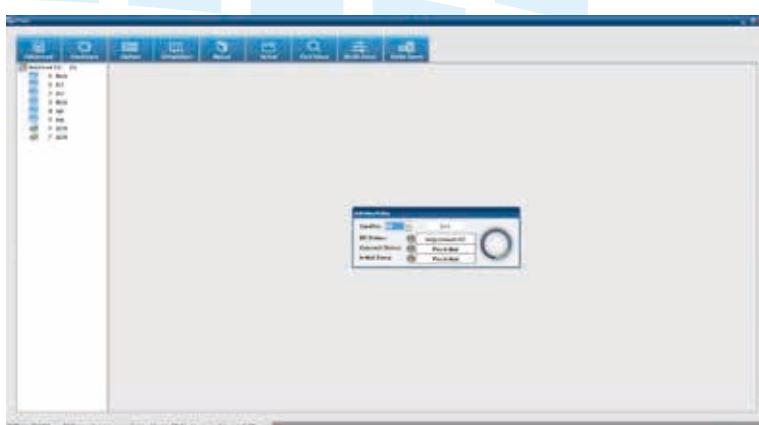

Delta's EtherCAT motion control solution also allows the system to quickly identify ESI files and offers the capability of real-time connection via EtherCAT for high-level integration. Its rapid communication can update commands between stations within 1ms~0.125ms to ensure accurate and prompt data transfer within the network.

Fieldbus Verification and Validation - EcNavi Software

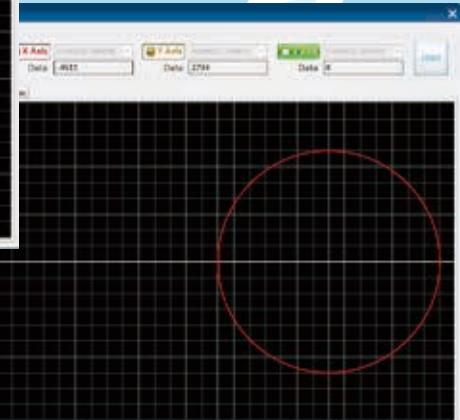

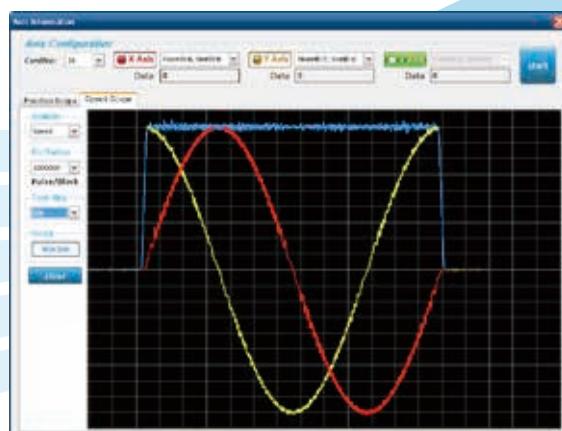

► EtherCAT Automation Software

EcNavi development software is for configuring an EtherCAT network that includes an EtherCAT master controller and slave devices for data communication, functional identification, programming and debugging. For new users of Delta's EtherCAT motion control, the EcNavi helps them become familiar with the configuration of the system and to complete the function verification and validation in real time.

► Hardware Structure Search

Provides search function for all slaves connected by EtherCAT to check hardware configuration and verify whether the network communication is established successfully via software

► Speed Curve Tracing

Offers real-time tracing for speed curves of current motion commands to achieve better synchronization effects between multiple axes

► Independent Control Unit

Helps users avoid writing complex programs and immediately verifies all motion commands with the servo drives to meet application requirements

► Multi-Axis Motion Control Mode

Offers a variety of sample programs and control modes for EtherCAT devices (e.g. Linear 2, Linear 3, Heli, Circle, Circle 2 and Circle 3) to help users easily edit and complete development programs for multi-axis motion control applications

Delta's High-Speed Motion Control System - DMCNET

Delta's Motion Control NETwork (DMCNET) is a high speed, real-time communication system, capable of controlling up to 12 axes of servo system units within 1ms simultaneously: with 3-axis helical and linear interpolation in 4 groups, or 2-axis linear and arc interpolation in 6 groups. It supports 64-bit dual-precision floating point, allowing high-precision system calculations and flexible operation, and also absolute commands, incremental commands and T-curve / S-curve velocity profiles for different uses. With built-in position, speed and torque control modes, and 35 homing modes, it is able to receive real-time servo information, parameters, or change control modes via communication command, offering fast communication and motion control for various applications

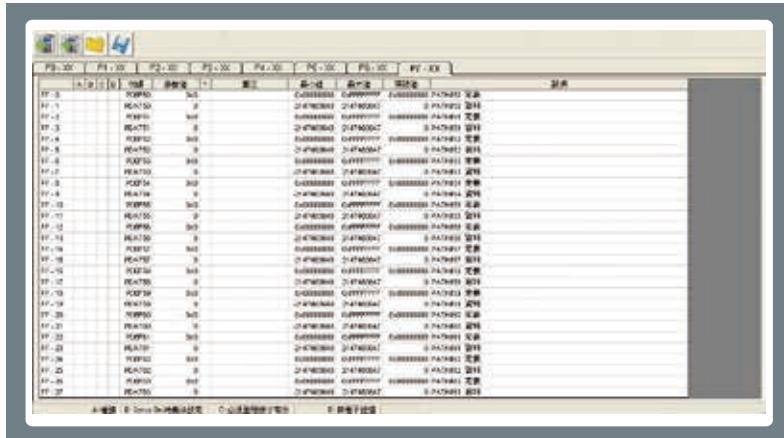

DMCNET Motion Control Structure

In addition to a one-wire communication protocol, the DMCNET also provides various options, such as 6-axis PCI-DMC-F02, 12-axis PCI-DMC-A02, and the PCI-DMC-B01 with pulse compare & capture functions. Based on user requirements, the servo drive can be combined with Servo Motor ASDA-A3-F Series, ASDA-A2-F Series, ASDA-B2-F Series or ASDA-B3-F Series. Delta helps users achieve best product performance and value with minimum investment

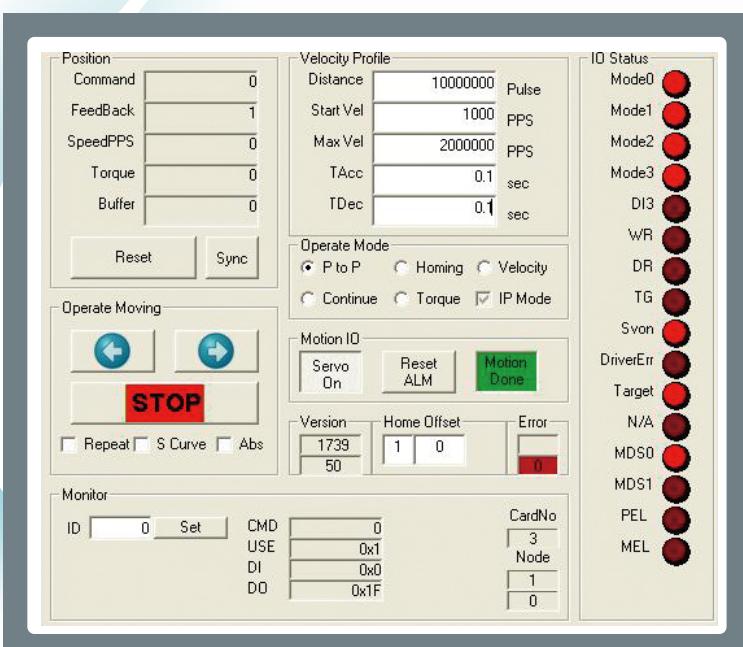

Fieldbus Verification and Validation - EzDMC Software

EzDMC Software provides simple editing functions for all the relevant parameters of the fieldbus communication and facilitates program development and a hardware system that is easily configurable. Even first time users of Delta's DMCNET motion control cards can utilize the motion control card functions.

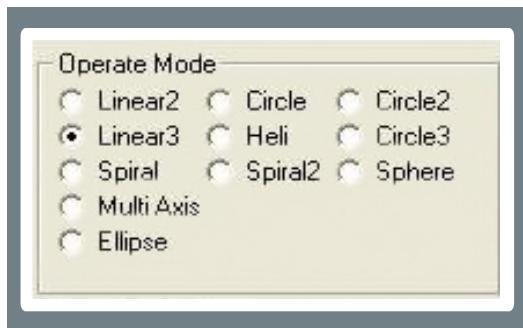

► User-Friendly Operation Interface

Helps users create and edit programs with clear images, easy-to-use parameter settings, and instruction disk for programming samples and function keys explanation

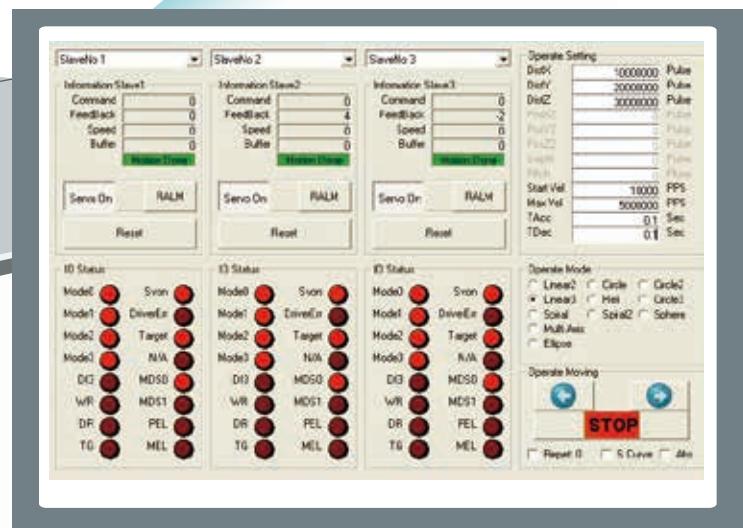

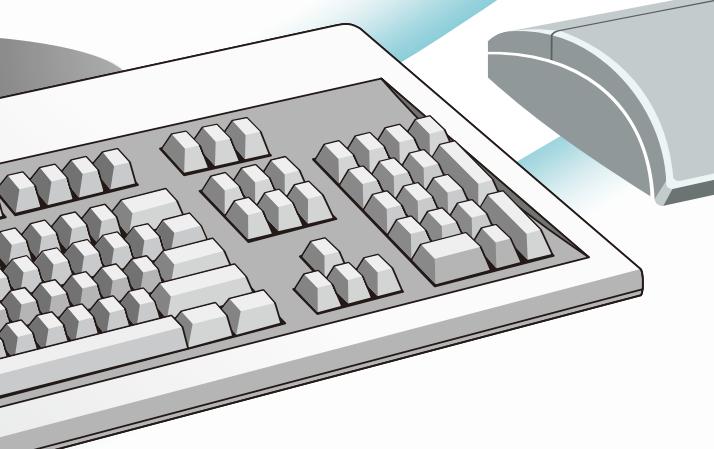

► Independent Control Unit

With the independent control unit, users can set up simple motions of the servo drives for flexible operation and management

► Multi-Axis Motion Control Modes

Offers a variety of sample programs and control modes (e.g. Linear 2, Linear 3, Heli, Circle, Circle 2 and Circle 3) for linear, arc and helical interpolation to supervise various multi-axis motions and execute programming for multi-axis motion control applications

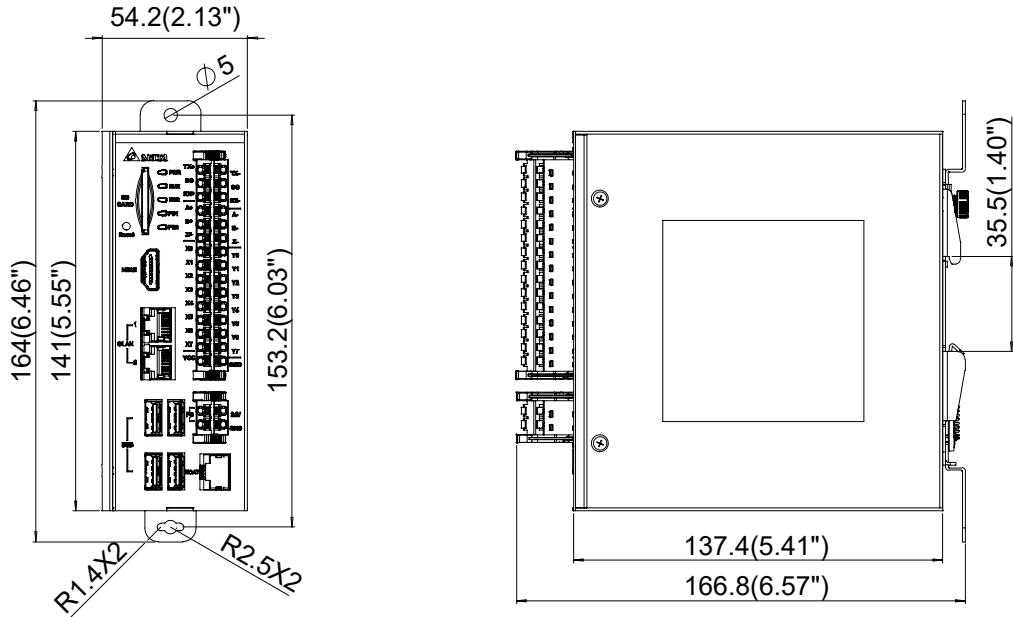

► Real Time Response and Feedback

Monitoring and displaying the status of the connected servo drives is completed in a timely and efficient manner

DMCNET Remote Modules

• ASD-DMC-RM04PI (4-Channel Pulse)

- 4 channels of 200 kHz pulse outputs (Pulse +Direction, CCW pulse +CW pulse, A phase + B phase)
- 4 channels of 200 kHz pulse inputs (CCW pulse +CW pulse, A phase + B phase)
- Digital Inputs x8/Digital Outputs x8
- Built-in Positive/Negative Limit and Home for each channel
- In Mode 1, each RM04PI module occupies one node number only, and interpolation motion is carried out within one module.
 - 4 channels occupy 1 node number only
 - 4 channels occupy one PDO and SDO
 - Performs interpolation motion of 4 channels within one RM04PI module only
 - Transfers data in cyclical patterns
 - Motion commands set by parameters
 - Point-to-Point motion mode, motion position calculation is performed within one RM04PI module
- In Mode 2, each RM04PI module occupies node numbers 1~4, which correspond to 4 channels. The interpolation motion can be carried out among different modules.

Gateway Type Remote Power Coupler

• Master Module - GA Series

- One GA01 can connect up to a maximum of 4 GE remote modules, of which there may be a maximum of four GE01PH modules.
- One GE01PH module occupies one node number.
- The EzDMC provides a software auto calculation function for calculating the numbers of start and end stations of the ASD-DMC-GA01.
